ContentEngine

AI-Powered Social Media Content Generator & Scheduler

PROBLEM STATEMENT

Solopreneurs and small brands spend hours creating content for multiple social platforms. Build a SaaS where a user inputs their brand voice and niche, and the AI generates a full week of social media content (posts, captions, hashtags, image suggestions) across platforms, with a built-in scheduling calendar.

MVP FEATURES (Must Build)

1. User auth + brand profile setup (niche, tone, target audience, brand keywords)
2. AI content generation: generate 7 days of posts for at least 2 platforms (Twitter/X, LinkedIn, Instagram)
3. Each generated post includes: caption text, relevant hashtags, image prompt or suggestion, best posting time
4. Content calendar view (week and month) to organize and schedule posts
5. Edit and regenerate individual posts before publishing
6. Content library to save and reuse top-performing templates

BONUS FEATURES (If Time Permits)

- * Direct publishing to Twitter or LinkedIn via API
- * AI image generation for post visuals using the image prompts

RULES & GUIDELINES

Timeline: You have 3 days. Deadline is March 13, 2026 at 11:59 PM IST.

Tech Stack: No restrictions. Use whatever you are most comfortable with.

AI Tools: Fully encouraged. Claude, ChatGPT, Copilot, Cursor, v0, or any other tool. We do not care how you build it. We care that it works and you understand what you built.

Completeness: It is not necessary to complete the entire project. Build as much as you can. We will judge you on what you ship, quality of work, and how you prioritize.

Deployment: Try to deploy using free tiers (Vercel, Netlify, Railway, Render, etc.). A live deployed link is a strong signal.

Documentation: Include a README.md with: what you built, tech stack, setup instructions, deployed link, and a short write-up on your approach and decisions.

Submission: Push code to a public GitHub repository. The submission form will be shared shortly.

This task has been assigned to you based on your application responses and your strengths.

Treat it as a real product you are building for a real user.
